Workplace Safety

Eye protectors need to be inspected regularly, both from a structural standpoint, but also to ensure the wearer has good visibility through the lenses. Pitted lenses, like dirty lenses, can be a source of reduced vision. They should be replaced. OSHA has pointed out that deeply scratched or excessively-pitted lenses are apt to break. In addition, slack, worn-out, sweat-soaked, or twisted headbands do not hold the eye protector in proper position. Always maintain eye protection per the manufacturer's instructions.
